

String

String, StringBuffer, StringBuilder

classes in Java

Part - I

String

String is immutable,
StringBuffer is mutable, thread-safe
StringBuilder is mutable, non-thread-safe

String

```
public final class String extends Object
    implements Serializable, Comparable, CharSequence {

}
```

- ❖ Object is super classes to all java classes, override equals(), hashCode(), toString() methods
- ❖ Because implemented from Serializable the String object's state can be moved from one location to another location in n/w, over distributed machines (through Socket Programming, RMI, EJB, CORBA, SOAP, REST)
- ❖ Because of Comparable the String objects are natural sorted while adding into TreeSet and TreeMap
- ❖ Because implements from CharSequence represents 16-bit chars in sequence

String

String is a fixed length char array.

Although String is a data type, it is a class unlike byte, short, int, long, float, double, boolean & char primitive data types.

String is a secondary data type (arrays and classes are secondary data types).

String internal representation is char array.

If we store "ActiveNET" in String (String str="ActiveNET"), A is stored @ 0th index, c is stored @ 1 index so on like that up-to T is stored in index 8 because "ActiveNET" is having 9 characters.

- String is a secondary data type, predefined class
- It internally represents char array

	1	2	3	4	5	6	7	8	9	10	11	12
	U	r	y	a	n	a	r	a	y	a	n	a

String

String class object creation syntax:

String class is having 15 constructors.

❖ Ex:

- ❖ String str="Anotonio";
- ❖ String str1=new String("Rishab");
- ❖ String str2="Tarun";
- ❖ String str3=new String("Miller");

public String()

public String(byte b[])

public String(byte b[], int offset, int len)

public String(char ch[])

public String(char ch[], int offset, int len)

public String(String str)

public String(StringBuffer sb)

public String(StringBuilder sb)
